Trace an individual utility by connecting the transmitter directly with the test leads

The Transmitter will automatically change modes based on which accessory is plugged in

The Receiver's high contrast LED screen is easy to read in full sunlight

Accurately and Safely Pinpoint Underground Utilities Before You Dig

Main applications

- **Locate** energized 50/60 Hz cables carrying current
- **Identify the location of all metallic utilities:** pipes*, energized and de-energized cables
- **Trace** individual pipes* or cables (energized or de-energized)
*Tracing of non-metallic pipes and conduits is possible after inserting metal fish tape or cable

Two passive modes using only the UAT-600-R Receiver

- **Passive power mode** (50/60 Hz) – tracing energized lines conducting current (no Transmitter necessary)
- **Passive radio mode** (RF) – using surrounding radio waves to trace underground utilities (no Transmitter necessary)

Three active modes using the UAT-600-T Transmitter

- **Induction** - the Transmitter will automatically start to radiate a signal around it using an internal antenna, used for tracing individual cables where there is no access to the line to connect test leads or a clamp
- **Direct connection with test leads** - the most reliable method to trace individual cable or a pipe
- **Clamp** (Included in the UAT-620 kit, optional for the UAT-610 kit) - provides an efficient and safe method of applying a locate signal to a cable, where it is not possible/safe to gain access to a cable for making an electrical contact

Special applications

- **2 frequency options:** 8 kHz and 33 kHz
- **Locate** non-metallic pipes and sewer lines
- **Take depth** and current measurements
- **Measure** voltage, resistance and output current

Identify Underground Cables, Pipes & Wires

The Amprobe AT-3500 discovers the location of underground pipes, cables, and wires. Its innovative design allows the AT-3500 to measure depths up to or exceeding 16 feet. The transmitter operates at a 33 kilohertz (kHz) frequency signal, which provides the most reliable results for most locating applications. The Amprobe AT-3500 also comes with a connection cable and alligator clip for connecting the transmitter to the buried pipe, cable, or wire to be traced.

Expert Features for Any Situation

The AT-3500 can be used in different modes for optimal tracing in any situation.

Passive power mode locates energized wires with a 50/60 Hz frequency and does not require a transmitter. The receiver alone detects electromagnetic fields emitted by buried energized lines conducting currents.

Passive radio mode does not require a transmitter and uses the receiver to detect radio waves coming from cellular towers, radio stations, etc. that are picked up and carried by underground metal objects, such as cables or pipes.

Inductive active mode uses the transmitter to wirelessly induce a signal into a buried pipe, cable, or wire. The receiver then detects the signal carried by the buried utility, which enables tracing.

In active direction connection mode, the transmitter is connected to the buried utility with test leads (provided there is an available access point to the utility). The transmitter then sends a signal across the wire or pipe, which enables tracing.

The AT-3500 can trace non-metallic pipes that do not conduct a tracing signal. Some of these pipes have embedded metal trace that will conduct signal for tracing. In active inductive or direct connection modes, the AT-3500 can also be used to trace other-nonmetallic pipes by using existing metal wires inside the pipe or inserting metal fish tape into the pipe.

AT-6000 Series Advanced Wire Tracer Kits

The AT-6000 series, available in three different kits, combines a receiver and powerful transmitter to locate energized and de-energized wires, breakers, and fuses. Whether you're a novice or an expert, the Amprobe advanced wire tracer kits will help you get the job done accurately, safely, and quickly.

"This is a great product

I carry the AMP-25 in my pocket on a daily basis, with a pocket meter. It is small enough that I don't notice it, and it is great to take on a check of a motor before you drag out the tool bag and the normal meter. Fits in tight places. Really easy to use and long stand by battery life."

Why You Need a True-rms Reading Multimeter.

Answer: True-rms instruments are accurate on any AC waveform. There are two basic AC measuring systems. One is "Average Sensing, RMS Indicating." This is the most common system because it is affordable and easy to manufacture. An instrument with this type of measuring system measures the average of a sine wave, and then multiplies it by 1.112, allowing the instrument to indicate RMS. This measuring system is only accurate on sine waves.

The second measuring method is called "RMS Sensing, RMS Indicating." An instrument with this type of measuring system computes the RMS value of the measured waveform (sine or otherwise). This is referred to as "True-rms" reading. This measuring system is accurate for any waveform. When an average sensing instrument is used on a non-sinusoidal waveform, measurement accuracy could be off as much as 50%. Since you may not know what type of AC waveform you are measuring, a True-rms instrument should be used whenever possible.

Is it Hot or Not?

Why utility crews trust the Amprobe TIC 300 PRO

Feedback from a major US utility and the 30 underground crews who serve a North American city

In every truck, on every trouble call, there's one tool crews reach for first to ensure their safety: the TIC 300 PRO. It's the go-to tool for underground crews servicing secondary power lines for a large Northeastern US utility company. Approximately three hundred TIC PRO 300 tools are currently in use throughout their system.

The crew's work takes them down manholes under historic cities where the infrastructure is aging, and the problems are frequent. Whether they're working on 120 V, 240 V or 5 kV or greater, on cables, transformers, or switches, they begin each job by checking for live power with the TIC 300 PRO non-contact voltage detector. Every crew carries at least one unit and they use it daily, often

multiple times each day.

Lights flash and the TIC 300 PRO beeps with increasing frequency as it nears a source of electricity, leaving technicians no doubt whether the source is live or not.

The crews like how simple the TIC 300 PRO is to use even with heavy gloves and full PPE on. They push one button to turn the unit on, another to select low or high range setting. After two decades of using TIC product line, the crews know it, trust it, and feel safe – it is exactly what they need.

“If you build quality, this is your tool.”

“I watched the Amprobe MT-10 in action when my insurance adjuster came to check out ceiling damage. The rafters without visible water damage showed moisture, the insulation that needed replacing was quickly identifiable and the wall showed the path the water took to the next floor. Wow, this will save waiting to see mold or disintegration long before permanent damage.”
